

Homework 0

Due date: 11:59pm on Monday Oct. 3rd

1 Probability and statistics

1. Bayes' theorem (15 points)

After your yearly checkup, the doctor has bad news and good news. The bad news is that you tested positive for a serious disease, and that the test is 99% accurate (i.e., the probability of testing positive given that you have the disease is 0.99, as is the probability of testing negative given that you don't have the disease). The good news is that this is a rare disease, striking only one in 100,000 people. What are the chances that you actually have the disease?

2. Mean and variance (15 points) Let X_1, X_2, \dots, X_n be i.i.d random variables distributed according to $\mathcal{N}(\mu, \sigma^2)$.

a.(5 points) Find two numbers a, b such that $aX_1 + b \sim \mathcal{N}(0, 1)$.

b.(5 points) Compute $\mathbb{E}[X_1 + 2X_2]$ and $\text{Var}[X_1 + 2X_2]$.

c.(5 points) Setting $\hat{\mu}_n = \frac{1}{n} \sum_{i=1}^n X_i$, compute the mean and variance of $\sqrt{n}(\hat{\mu}_n - \mu)$.

3. Empirical distribution (25 points)

For any function $g: \mathbb{R} \rightarrow \mathbb{R}$ and random variable X with PDF $f(x)$, recall that the expected value of $g(X)$ is defined as $\mathbb{E}g(X) = \int_{-\infty}^{\infty} g(y)f(y)dy$. For a boolean event A , define $\mathbf{1}\{A\}$ as 1 if A is true, and 0 otherwise. Fix $F(x) = \mathbb{P}\{X \leq x\}$. Let X_1, \dots, X_n be independent and identically distributed random variables with CDF $F(x)$. Define $\hat{F}_n(x) = \frac{1}{n} \sum_{i=1}^n \mathbb{1}\{X_i \leq x\}$ to be the empirical CDF. Note, for every x , that $\hat{F}_n(x)$ is an empirical estimate of $F(x)$.

a.(5 points) For any x , what is $\mathbb{E}\hat{F}_n(x)$?

b.(15 points) Fix an x . Show that $\text{Var}\hat{F}_n(x) = \frac{F(x)(1-F(x))}{n}$.

c.(5 points) Using your answer to b, show that for all $x \in \mathbb{R}$, we have $\mathbb{E}\left(\hat{F}_n(x) - F(x)\right)^2 \leq \frac{1}{4n}$.

2 Linear algebra

4. **Linear systems** (10 points) Let $A = \begin{bmatrix} 0 & 2 & 4 \\ 2 & 4 & 2 \\ 3 & 3 & 1 \end{bmatrix}$, $b = [-2 \quad -2 \quad -4]^\top$, and $c = [1 \quad 1 \quad 1]^\top$.

a.(5 points) What is Ac ?

b.(5 points) What is the solution to the linear system $Ax = b$?

5. **Rank** (20 points) Let v_1, \dots, v_n be a set of non-zero vectors in \mathbb{R}^d . Let $V = [v_1 \ v_2 \ \dots \ v_n]$ be the vectors concatenated.

a.(5 points) What is the minimum and maximum rank of $\sum_{i=1}^n v_i v_i^\top$?

b.(5 points) What is the minimum and maximum rank of V ?

c.(5 points) Let $A \in \mathbb{R}^{D \times d}$ for $D > d$. What is the minimum and maximum rank of $\sum_{i=1}^n (Av_i)(Av_i)^\top$?

d.(5 points) What is the minimum and maximum rank of AV ? What if V is rank d ?

6. **Vectorized notation** (15 points) For possibly non-symmetric $\mathbf{A}, \mathbf{B} \in \mathbb{R}^{n \times n}$ and $c \in \mathbb{R}$, let $f(x, y) = x^\top \mathbf{A}x + y^\top \mathbf{B}y + c$. Define

$$\nabla_z f(x, y) = [\partial f z_1(x, y) \quad \partial f z_2(x, y) \quad \dots \quad \partial f z_n(x, y)]^\top.$$

a.(5 points) Explicitly write out the function $f(x, y)$ in terms of the components $A_{i,j}$ and $B_{i,j}$ using appropriate summations over the indices.

b.(5 points) What is $\nabla_x f(x, y)$ in terms of the summations over indices *and* vector notation?

c.(5 points) What is $\nabla_y f(x, y)$ in terms of the summations over indices *and* vector notation?
